

Setting the Fenn Box

A - Undo the hasp and staple.

B - Open the lid of the Fenn Box completely.

C - Make sure both safety catch and trigger are pointing outwards from the trap.

D - Place your thumb in the pull-wire.

E - Place your other thumb over the round wire jaw, ease the jaws apart against the force of the springs. The springs are very strong and it is a good idea to practice opening and closing the jaws slowly to improve technique and gain confidence.

F - With the jaws held fully open, slip the safety catch onto the round jaw, leaving the brass trigger still pointing outwards. This will disable the entire mechanism and prevent the jaws from closing.

Even with the safety catch on the trap should still be treated with caution.

G - To set the trap; the brass trigger plate must be turned over the top of the round wire jaw and located within the brass notch on the treadle plate. The jaws will need to be pressed open a little further and the treadle plate raised before the two parts can be engaged.

Always ensure that the safety catch is effectively positioned over the round wire jaw during these operations.

H - With the safety catch still in position bait your trap with peanut butter or a bait of your choice, then remove the safety hook from over the jaw. We recommend using a stick or a piece of wire.

I - With the safety catch removed the force of the springs will clamp the jaws together when the squirrel puts pressure on the treadle plate disengaging it from the trigger holding the round wire jaw.

J - Lastly close the lid of the Fenn Box and place at your selected trapping location, the box can be locked closed if required.

When trapping make sure you always try to prevent catching non-target species by restricting the entrance if needed.
